

The Power of the Conscious Oral Exam: Improving Estimates and Owner Communication

Naomi Hoyer, DVM, Diplomate AVDC
Assistant Professor, Colorado State University
Consultant to Heska
January 25, 2024

Learning objectives

Develop a concrete strategy for an effective conscious oral exam that maximizes opportunities for effective treatment planning

A little bit more about me

“Growing up, I
though that
quicksand was
going to be
a much bigger
problem than it
turned out to
be.”

--John Mulaney,
comedian

Blazing Saddles

The Princess Bride

Why quicksand?

Let's avoid this!

EXAM FINDINGS:

General Appearance: BAR

Integument: smooth and shiny haircoat, no erythema/lesions/masses, non-reducible umbilical hernia

EENT: eyes clear and bright, no ocular or nasal discharge, ears clean, no cough elicited on tracheal palpation

Respiratory: eupneic with normal bronchovesicular sounds in all quadrants, no crackles or wheezes ausculted

Cardiovascular: CRT <2 seconds, mucous membranes pink and moist, no murmurs or arrhythmias ausculted, strong and synchronous femoral pulses

Dental/GI: no gingivitis; Grade 3 dental calculus 108, 109, 208, 209, rest of teeth grade 1 abdomen soft and non-painful on palpation with no palpable organomegaly/masses

Musculoskeletal: ambulatory all four limbs with no lameness or pain

Nervous: intact menace response OU, intact palpebral response OU, normal facial symmetry, normal proprioceptive placing all four limbs

Hemolymphatic: mandibular, prescapular and popliteal lymph nodes are soft, smooth, and symmetrical

Rectal: no rectal masses, sublumbar LN not palpable

Repro: externally normal

Or this...

communications by the Defendants and based on the estimate. Following an examination of [REDACTED] DEFENDANTS stated that [REDACTED] only needed an anesthetic tooth cleaning and the possible extraction of one tooth that might have a cavity because they noticed one spot on that one tooth.

2. DEFENDANTS later pressured PLAINTIFFS, over the telephone while [REDACTED] was under anesthesia, into agreeing to expand the scope of the contract by adding 15 more costly tooth extractions. DEFENDANTS stated that these tooth extractions were necessary and that, in particular, six were baby teeth that had not fallen out. [REDACTED] has not, however, grown adult teeth into the voids left by extraction of the six alleged baby teeth. PLAINTIFFS further are unclear why DEFENDANTS failed to detect the 15 other teeth that required extraction during [REDACTED] annual examination.

Conscious oral exam and treatment planning

What are the challenges?

Client challenges	Patient challenges
Creating realistic expectations	Behavior
Creating estimates	Behavior
Maximizing opportunities for communication	Anatomy
TIME!	

The spectrum of patients for oral exam...

The Freeze

The Ferocious

The Fidget

The Feline

What tools do we use most often?

Dogs
2-5 mg/kg

Cats
10-20 mg/kg

Parts of the Conscious oral exam

1. Extraoral
2. Occlusion
3. Oral soft tissue
4. Teeth!!!

Let's look at these one at a time...

1. Extraoral

Swallowing, chewing & food prehension

Facial musculature & bone symmetry

External ear canals & TMJ

Eyes

Nose

Lymph nodes and salivary glands

This portion of the oral exam is critical, and can be very relaxing and low stress

2. Occlusion

Start screening for traumatic malocclusions at the first puppy visit

Classes of malocclusion?

Class 1	Class 2	Class 3
		

When are malocclusions significant?

3. Oral soft tissue

Gingiva, mucosa, tongue, palate

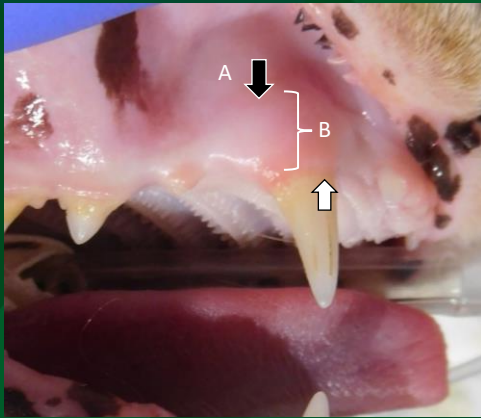

This is the most important (and most often forgotten) part of the oral exam

Normal Dog Periodontal Anatomy

- A—Alveolar mucosa—elastic
- B—Attached gingiva—non-elastic, you must have 2-3 mm at the minimum
- Black arrow—Mucogingival junction
- White arrow—free gingiva

Normal cat periodontal anatomy

A—Alveolar mucosa—elastic

B—Attached gingiva—non-elastic, you must have at least **2-3 mm**

Black arrow—Mucogingival junction

White arrow—free gingiva

Gingivitis

- Inflammation of the attached gingiva
- Presence of gingivitis is the first stage of periodontal disease
- When gingivitis is present without associated bone loss (which you need dental radiographs to evaluate properly) it is the only stage of periodontal disease that is reversible

Severe localized gingivitis should always be a red flag (dogs & cats)

Gingival recession...

Gingival recession is always associated with alveolar bone loss

But mild recession DOES NOT equal small amounts of bone loss

Look for very subtle recession

Muco-gingival junction

Gingival enlargement

Causes

- Idiopathic
- Periodontal Disease
- Breed disposition
- Cyclosporine
- Calcium channel blockers
- Anti-seizure medications

Mucosa—Flip the lip

8 year old
M/N
Mixed Breed Dog

Presented for significant oral pain,
started one month after last dental
procedure

Tongue—

Palate

4. Teeth—save the best for last!!

How many teeth there are?

How many teeth you can see?

Dogs

How many teeth there are?
42

How many teeth you can see well?
~30 (depending on a dog's behavior)

Dogs

How many teeth there are?

How many teeth you can see well?

Cats too

How many teeth there are?
30

How many teeth you can see well?
~18 (extremely variable with behavior of cat!)

Cats too

Know what they should look like...

What am I not talking about?

Which of these dogs has periodontal bone loss?

It is not always obvious...

Calculus \neq Periodontal disease

If we are just looking at calculus to identify which patients need anesthetized dentistry, we are missing disease

How are we going to write about this in our records?

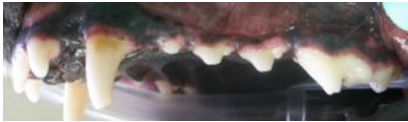

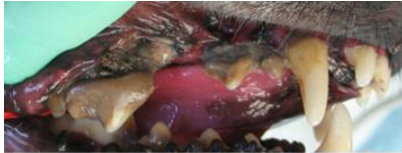

Let's talk about the difference between staging periodontal disease and grading dental disease

Staging periodontal disease—applies to one tooth (not going to happen during a conscious oral exam)

Stage	Attachment loss (%)	Treatment
1	None	Cleaning + home care
2	< 25%	Cleaning +/-root planing, +/- perioceutics, +/- extraction, home care
3	25-50%	Cleaning +/- root planing, periodontal surgery, +/- extraction, home care
4	>50%	extraction

Grading dental disease—applies to the whole mouth

Grade 1	Grade 2
	
Grade 3	Grade 4
	

A system agreed upon by the entire hospital that is applied to a patient (not a tooth) and assists with creation of estimates and scheduling
